## Purified Water Tank Storage Tank Flanged Sector Design

## Use

- The flanged-sector storage tank has a vertical design, limiting the space occupied by the installation
- Making use of the hydraulic head of the tank, there is a volume of water already at a certain pressure, ready to be reused for process purposes or discharged into the receiving body of water
- Flanged-sector storage tanks offer considerable advantages for fixed-type installations where significant volumes of water are stocked

## Main Characteristics and Accessories

- Made with sanded or pickled, thick carbon steel sheeting and double coats of epoxy primer
- Set of fasteners and closed-cell gaskets for assembly of the flanged sectors
- Internal piping for replenishing clean water and overflow pipe
- Level probes for replenishing clean water
- Flush bottom storage tank with manual valve
- Connection for clean water recovery with shut off valves
- Inspection door for easy maintenance
- Coupling for cone washing system (optional)
